

# An Upgraded Polarized $^3\text{He}$ Atomic Beam Source for the Cryo. nEDM Exp. @ SNS in ORNL

Prajwal T MohanMurthy

+ *J. Kelsey, J. Dodge, R. Redwine*

& *P. Binns, B. O'Rourke*

MIT

1. Why  $^3\text{He}$  ABS?
2. Basic Components:
  - Cryo-chamber
  - MCP & Actuation system
  - Quadrupole magnet
3. Major Upgrades (easier to discuss knowing the components):
  - Vertical orientation
  - MCP
  - Actuation system
4. Preliminary Findings (aided by simulations)

# §1 Why polarized $^3\text{He}$ ?

$^3\text{He}$  is a good: **co-magnetometer** + neutron detector

**SQUID loops**

Measurement Cells

- UCN: 500k
- $^3\text{He}$ :  $10^{16}$
- $^3\text{He}/^4\text{He} \sim 10^{-10}$

# § 1 Why polarized $^3\text{He}$ ?

$^3\text{He}$  is a good: **co-magnetometer** + neutron detector

**SQUID loops**

Measurement Cells

 UCN: 500k  
  $^3\text{He}$ :  $10^{16}$   
 $^3\text{He}/^4\text{He} \sim 10^{-10}$

UCNs and  $^3\text{He}$  are moving and precessing

# §1 Why polarized $^3\text{He}$ ?

$^3\text{He}$  is a good: **co-magnetometer** + neutron detector

# § 1 Why polarized $^3\text{He}$ ?

$^3\text{He}$  is a good: **co-magnetometer** + neutron detector

# §1 nEDM @ SNS-ORNL

## Experiment Design

### Helium-3 Services

- Prepare polarized  $^3\text{He}$
- Isotopically purify  $^4\text{He}$  each measurement cycle

### Central Detector System

- Generate electric field
- Store  $^3\text{He}$ , neutrons
- Monitor  $^3\text{He}$ , neutron precession frequencies

### Magnet Coil Package

- Inner magnetic shielding
- Generate uniform B-field

Outer magnetic shielding  
Cancellation coils

Magnetically Shielded Enclosure

Cold Neutrons

Guide 8.9Å into apparatus

# §2

# ABS Components

$^3\text{He}$  ABS part of  $^3\text{He}$  services

# §2 ABS Components

$^3\text{He}$  ABS part of  $^3\text{He}$  services: minus dil. ref., purifier, injection

## §2

# ABS Components

# §2

# ABS: Cryo-Vessel

Uses both  $^4\text{He}$  (for cooling) &  $^3\text{He}$   
! Not a dilution refrigerator

Produces cold  $^3\text{He}$   
polarized atoms

- $\sim 1.3 \text{ K}$  ( $112 \mu\text{eV}$ )
- Flux  $\gtrsim 10^{14}$  atoms/s

## §2

# ABS: Multi Channel Plate

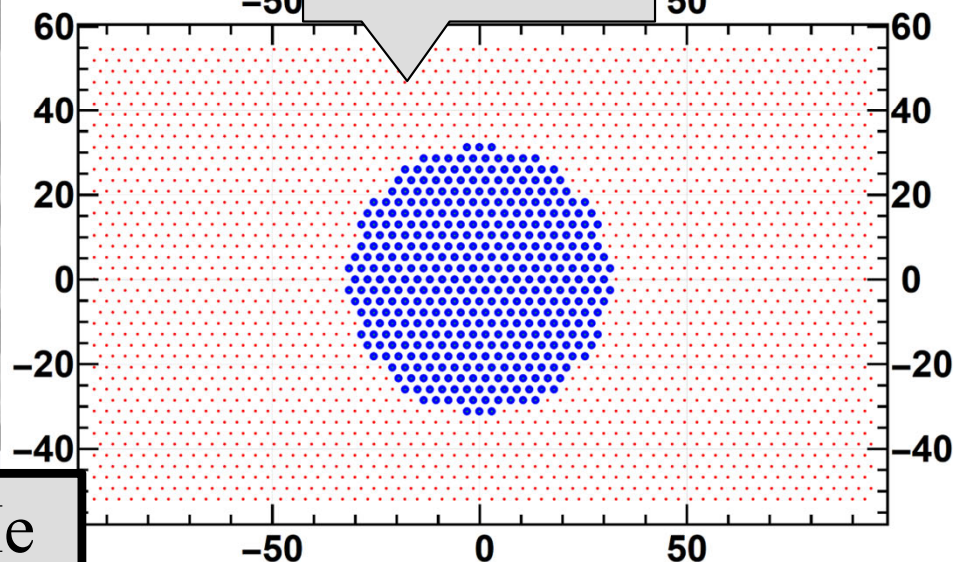

Schematic

Microscope (2  $\mu\text{m}$ )

- Arranged in hexagon (side 25  $\mu\text{m}$ )
- Pores at vertex and center of hexagon
- Pore diameter: 5  $\mu\text{m}$
- Pore length: 0.5mm

Simulation

Quartz MCP: Unidirectional  $^3\text{He}$

beam

# §2

# ABS: Quad. Magnet

Quadrupole Magnet

Shim Magnet

# §2

# ABS: Quad. Magnet

## Spin-Tracking , Ray-Tracing Simulation

### UCN: Can be completely reflected

- $E < 300 \text{ neV}$
- $\Delta E = \mu_m \approx 60 \text{ neV/T}$

### $^3\text{He}$ : Only $>\text{deflected}<$

- $1.3 \text{ K} \approx 86 \mu\text{eV}$
- $\Delta E = \mu_m \approx 67 \text{ neV/T}$
- Making initial angle very important

## Pre HV-cavallo design “Thomas the Tank Engine”

$^3\text{He}$  ABS came in from the side

# Upgrade: Vertical

Now: <sup>3</sup>He ABS comes in vertically down → Major eng. design

# §3 Upgrade: MCP

Before:  $^3\text{He}$  ABS used a needle valve to effuse

**Schematic**

**Microscope (2  $\mu\text{m}$ )**

Angular distribution set by:  
Diameter/length = 0.01/0.5

Angular distribution set by:  
Diameter/length = 0.005/0.5

0.5mm

10  $\mu\text{m}$

0013 20KV X2,500 10µm W016

CLASSIFICATION:				ORIGINAL ISSUE			
DRAWING#	PART#	TITLE BLOCK#	REV	CLASS REVIEW	REVISIONS	DATE	BY
ORIG	SIGNATURE	DATE	GROUP	LOS ALAMOS		EDM $^3\text{He}$ SOURCE, VALVE N	
DRAWN	BOISSEVAIN	4-02	P-25	LOS ALAMOS NATIONAL LABORATORY		LOS ALAMOS, NEW MEXICO, 87545	
CHECKED				TOLERANCE - (UNLESS OTHERWISE NOTED)			
PROJ ENGR				X: #	0. XX #	ANG: #	
APPROVED				SCALE	TOTAL SHEETS	DRW	
RELEASED				.X: #	0. XXX #	FIN: #	12

Now:  $^3\text{He}$  ABS uses a Quartz MCP

Constraints the angular distribution to (before:  $1.5^\circ$ )  $0.5^\circ$

# Upgrade: Actuation

Before:  $^3\text{He}$  nozzle was fixed

Now:  $^3\text{He}$  nozzle can be moved – pitch and yaw

# § 3 Upgrade: Actuation

MCP: Unidirectional  $^3\text{He}$  beam  
Actuation: Gives direction control

Produces cold  $^3\text{He}$   
polarized atoms

- $\sim 1.3 \text{ K}$  ( $112 \mu\text{eV}$ )
- Flux  $\gtrsim 10^{14}$  atoms/s

# From Simulation

- Key performance requirement:
  - 99.5% @ 1.25K
  - 99% @ 1.55K

# §3 Summary

1. Major upgrades:
  - Redesign of new larger cryo-vessel: vertical orientation
  - Use of MCPs
  - MCP actuation
2. New spin-tracking code:
  - Helps understand the final polarization
  - Addresses depolarization concerns
  - Quantifies material properties:  $\eta$
3. **New setup will be tested in 2024**  
**=> Should Deliver Key Param.: flux ( $10^{14}$ . $^3\text{He/s}$ ) & Pol. (99.5%)**

**DOE: DE-SC0019768**  
**NSF: PHY-1822502**
